# To-do list

## ☐ Model 90.91:

- $r = 0$  (10 realizations of CMB and noise)
- $r = 0.003$  (10 realizations of CMB and noise)

## ☐ Model 90.92:

- $r = 0$  (10 realizations of CMB and noise)
- $r = 0.003$  (10 realizations of CMB and noise)

# To-do list

## ☐ Model 90.91:

- ✓ done! •  $r = 0$  (10 realizations of CMB and noise)
- ✓ done! •  $r = 0.003$  (10 realizations of CMB and noise)

## ☐ Model 90.92:

- ✓ done! •  $r = 0$  (10 realizations of CMB and noise)
- ✓ done! •  $r = 0.003$  (10 realizations of CMB and noise)

$$r = 0$$

90.91 & 90.92

# Note on the likelihood

The component separation exercise has been performed on sky maps with full lensing contamination.

Suppose that PICO can perform e.g. 60% delensing, then the fraction of residual lensing power will be  $A_L = 0.4$  after delensing.

Now for the  $r$  forecasts, we do the following shortcut to account for “delensing”:

- ❑  $C_\ell^{BB,NILC}$  is corrected for the residual noise bias and the residual lensing bias:

$$C_\ell^{\text{CMB}} + C_\ell^{\text{fgds}} = C_\ell^{BB,NILC} - C_\ell^{\text{noise}} - A_L C_\ell^{\text{lens}}$$

- ❑ Build a simple Gaussian likelihood to fit  $r$  only:

$$-2 \ln \mathcal{L}(r) = \sum_{\ell=2}^{\ell_{\max}} \left( C_\ell^{\text{CMB}} + C_\ell^{\text{fgds}} - r C_\ell^{\text{prim}}(r=1) \right) \mathbf{M}_{\ell\ell'}^{-1} \left( C_\ell^{\text{CMB}} + C_\ell^{\text{fgds}} - r C_\ell^{\text{prim}}(r=1) \right)$$

- ❑ The covariance matrix includes cosmic/sample variance of residual lensing signal, residual foregrounds and residual noise (and cross-terms):

$$\mathbf{M}_{\ell\ell} = \frac{2}{(2\ell+1)f_{\text{sky}}} \left( C_\ell^{BB,NILC} - (1 - A_L) C_\ell^{\text{lens}} \right)^2 = \frac{2}{(2\ell+1)f_{\text{sky}}} \left( C_\ell^{\text{CMB}} + A_L C_\ell^{\text{lens}} + C_\ell^{\text{fgds}} + C_\ell^{\text{noise}} \right)^2$$

 Expected residual lensing cosmic variance
