

Couchdb & Lucene

- Must install and configure Couchdb on local machine (still in progress on my mac)
- <http://www.couchbase.com/downloads> to get “Couchbase Server”
- Install couchapp `sudo easy_install couchapp` (failing on my machine OSX 10.5.8)
- Install couchdb-lucene

git & Persephone

- Install “git” which is from what I understand a version-control client of sorts (I found it with fink and installed)
- git clone <https://github.com/nepahwin/persephone.git>
(need to install this)

Goals

- Install component programs CouchDBX, Couchapp, persephone (current step, trying on Mac OSX 10.5.8)
- Host a database akin to James' Majorana test database, locally and learn how to place new materials in
- Seek hosting options and standardized methods for users to update
